

SAFETY, HEAD FIRST

The technology that makes your head safer when you're behind the wheel.

By **JOHN HANSEN**

THE SKULL

The skull is the most important part of the head, protecting the brain and other vital organs. It is made of bone and is the hardest part of the body.

THE BRAIN

The brain is the most important part of the body, controlling all of the body's functions. It is made of soft tissue and is very delicate.

NECKLINE

The neckline is the area of the body where the head meets the neck. It is a vulnerable area and is often the point of impact in a car accident.

HEAD REST

The head rest is a device that is designed to support the head and neck in the event of a rear-end collision. It is located at the top of the car seat.

WHISKEY

Whiskey is a type of alcohol that is made from grain. It is often consumed as a beverage and is known for its strong flavor.

Someone that's been drinking alcohol will have a harder time driving a car. The more alcohol you drink, the more your judgment is impaired. It's not just about the driver, though. The car itself is also affected. Alcohol can make the car's engine run less smoothly, which can lead to a loss of power. It can also make the car's brakes less effective, which can lead to a longer stopping distance. And, of course, there's the risk of a car accident. If you're drinking and driving, you're putting yourself and others in danger.

Alcohol is a depressant, which means it slows down the central nervous system. This can lead to a loss of coordination and balance, which can make it difficult to drive. It can also lead to a loss of reaction time, which can be dangerous when you're on the road. In fact, according to the National Highway Traffic Safety Administration, alcohol is a leading cause of car accidents. So, if you're drinking, don't drink and drive.

LUCKY THE GIGGS TO DRIVE

It's a common sight: a car accident involving a drunk driver. In fact, according to the National Highway Traffic Safety Administration, alcohol is a leading cause of car accidents. So, if you're drinking, don't drink and drive.

Q & A

Q How often should I get my car's oil changed?

A It depends on the type of oil you use and the type of driving you do. Generally, you should get your oil changed every 3,000 to 5,000 miles.

Q What are the benefits of a head rest?

A A head rest can help reduce the risk of whiplash in the event of a rear-end collision. It supports the head and neck, preventing them from snapping forward.

Q How does alcohol affect driving?

A Alcohol is a depressant that slows down the central nervous system. This can lead to a loss of coordination and balance, which can make it difficult to drive.

Q What are the symptoms of a head injury?

A Symptoms of a head injury can include dizziness, nausea, headache, and confusion. If you experience any of these symptoms after a car accident, you should seek medical attention immediately.

Q How can I stay safe while driving?

A You can stay safe while driving by wearing your seat belt, driving sober, and following traffic laws. You should also get your car's brakes and tires checked regularly.

Q What are the risks of drinking and driving?

A Drinking and driving is a dangerous activity that can lead to a car accident. It can also lead to a loss of control of the car, which can be fatal.

Q How can I help someone who is drinking and driving?

A If you see someone who is drinking and driving, you should call the police. You should also offer them a ride home if you can.
